Under the “dual carbon” goal, renewable energy is embracing a new leapfrog development. The growth of global energy demand and the aggravation of environmental pollution have prompted the rapid development of renewable energy, in which the solar photovoltaic/thermal (PV/T) heat pump system, as a technology integrating photovoltaic power generation and thermal energy conversion, has. The system incorporates a thermal storage tank to ensure continuous operation during periods of insufficient solar energy. This paper investigates single-flash, double-flash, and triple-flash cycles each integrated with parabolic trough solar collectors and thermal storage components, analyzing.
