

Battery cabinet feedback current refers to

Overview

Current feedback refers to any closed-loop configuration in which the error signal used for feedback is in the form of a current. A current feedback op amp responds to an error current at one of its input terminals, rather than an error voltage, and produces a corresponding output. Which of the following is correct?

Data centers that comply with NEC Article 645 are now referred to as ITE centers. In an ITE center, attention to HVAC, security, fire suppression, and monitoring problems take priority over electrical problems. Although we are all familiar with voltage feedback operational amplifiers, those using current feedback can be a little different. Its prime advantage is that it does not suffer from the strict gain/bandwidth trade-off typical of normal op amps.
