

Building Energy Storage System Knowledge

Overview

Energy storage systems are designed to store excess energy generated by on-site power sources, such as solar panels or wind turbines, for later use. This allows buildings to reduce their reliance on the grid, lower their energy bills, and minimize their carbon footprint. With a large battery, for example, excess electricity generated by rooftop solar can be stored. Battery Energy Storage Systems (BESS) represent a critical component in modern renewable energy infrastructure, with lithium-ion batteries leading the market due to their high energy density and declining costs.
