

Container refrigeration dedicated power generation

Overview

Reefer gensets, or refrigerated generators, are specialized power generation units designed to maintain the necessary temperature controls within refrigerated containers during transport. These containers are typically powered through a combination of external and onboard energy sources. Externally, they connect to shore power at ports or depots via electrical outlets, ensuring continuous cooling while stationary. During transport, onboard diesel generators or battery systems take over. So a Reefer Container is basically a massive refrigerator under the guise of a shipping container, so obviously it needs to be powered somehow right?

These refrigerated containers play a vital role in storing and transporting temperature-sensitive goods such as food, pharmaceuticals, and chemicals. How Are Refrigerated Containers Powered?

Refrigerated containers, also known as reefers, play a crucial role in global trade by preserving perishable goods during transport. These specialised containers come in various sizes, each suited for different cargo volumes and transportation needs. In this study, a method is proposed to minimize electrical load fluctuations and improve the efficiency of engine generator operation by managing refrigerated ship containers through an integrated control system.
