

Coordinated control method of DC microgrid

Overview

This system utilises a hierarchical coordinated control method (HCCM) with primary virtual resistance droop control integrated with state-of-charge (SoC) management and secondary control for voltage regulation and proportional current distribution through optimised communication. This system utilises a hierarchical coordinated control method (HCCM) with primary virtual resistance droop control integrated with state-of-charge (SoC) management and secondary control for voltage regulation and proportional current distribution through optimised communication. A novel enhanced distributed coordinated control framework, based on adaptive event-triggered mechanisms, is developed for the efficient management of multiple hybrid energy storage systems (HESSs) in islanded DC microgrids (MGs). We propose a hierarchical distributed control framework integrating. Based on the analysis of the energy storage requirements for the stable operation of the DC microgrid, battery-supercapacitor cascade approach is adopted to form hybrid energy storage system, in a single hybrid energy storage subsystem for battery and supercapacitor and in the microgrid system of. In order to ensure the stable operation of the microgrid, firstly, the paper proposes a coordinated control strategy of multiple operation conditions for DC microgrid taking time-of-use into account. Through the mutual coordination of port parameters and control instructions between the local.
