

Distributed energy storage installed on the user side

Overview

DERS can also be located “behind the meter,” or directly on the site of the user, like rooftop solar panels or household batteries. DERS are gaining attention among policymakers for several reasons. DERs can be technologies that generate and store power but can also be technologies or operator functions that manage how much and what kind. Based on this, a planning model of industrial and commercial user-side energy storage considering uncertainty and multi-market joint operation is proposed. Firstly, the total cost of the user-side energy storage system in the whole life cycle is taken as the upper-layer objective function. Distributed generation, storage, electric vehicle chargers, grid-interactive buildings and microgrids, energy efficiency, and demand response.
