

Generator air inlet and exhaust shaft size

Overview

Generator room air inlet and outlet shaft spac velocities and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and transformers. The documents contain calculations for sizing. The result is the required size of the air inlet opening in the building. 70, to obtain 576 square inches. (An opening that measures 24 X 24 inches (576 square inches). Like ICE-powered automobiles, ICE electrical generator systems have radiators and exhaust systems that reject heat. To provide an environment in which personnel can work comfortably and effectively. Enclosed generators are generally specified for applications where the generator system is to be installed. Therefore, when designing the air intake and exhaust of the equipment room, the following matters should be paid attention to: Air Inlet Starlight Power recommends customers to adopt the sloping upper air intake method close to the control panel side of the unit, and add louvers and metal.
