

Generator rotor blade assembly process

Overview

Rotor assembly works in progress for a Wind Turbine Generator (WTG) as part of wind power project execution. This process includes hub preparation, blade mounting, bolt tightening, torque & tensioning, and final quality checks as per OEM standards. However, a number of incidences have occurred over the years that can adversely impact reliable operation of generator rotors and, ultimately, production of electrical power. Anatomy of a typical rotor blade and its manufacturing process are. A method of repairing a generator blower hub assembly (12) and rotor blade (10) removed from the generator blower hub assembly (12) where the rotor blade (10) has fatigued material in threads of a threaded blade root (14). The method may include removing (32) at least a portion of the fatigued. Structural Integrity Associates provides a comprehensive, fully integrated solution for assessment of turbines and generators. Our team offers an in-depth understanding of the complexities associated with turbine and generator operation and familiarity with industry issues, including known flaw. Mechanical Dynamics and Analysis inspected and repaired a double flow low pressure (DFLP) rotor and inner cylinder after a generator motoring incident.
