## Overview

---

A wind turbine's electricity generation varies significantly based on size and wind conditions, but typical modern utility-scale turbines generate between 2 to 3 megawatts (MW), equivalent to 2000-3000 kilowatts, while smaller residential turbines might produce only a few kilowatts. There are over 70,000 utility-scale wind turbines installed in the U. However, there's no black-and-white answer to how much energy a wind turbine produces, as energy output varies depending on. Most turbines automatically shut down when wind speeds reach about 88.5 kilometers per hour (55 miles per hour) to prevent mechanical damage. This reduces electricity production when high winds occur and people need continuous power from the wind. Utility scale includes facilities with at. U.
