

# How many meters are the blades of a 2kW wind turbine

## Overview

---

According to The United States Department of Energy, most modern land-based wind turbines have blades of over 170 feet (52 meters). This means that their total rotor diameter is longer than a football field. The largest turbine is GE's Haliade-X offshore wind turbine, with blades 351 feet long (107. The optimal blade length for wind turbines depends on factors such as wind speed, turbine height, and site-specific conditions. Longer blades have higher power supply capacities and greater power production. The wind-swept area, the total planar area covered by the rotor, is directly affected by. These turbines are equipped with more efficient blade designs that optimize airfoil profiles for maximum lift and minimum drag, capturing more energy from the wind across a variety of conditions. Unicomposite, an ISO-certified pultrusion specialist, supplies the spar caps and stiffeners that let those mega-structures stay light, stiff, and reliable — giving.
