

# How to check the model of base station communication equipment

## Overview

---

Base station testing is a thorough procedure that incorporates several elements and approaches to assess the effectiveness of base stations. Let's examine the main components and factors that go into base station testing: 1. We will also discuss how to stay compliant with standards using the new designs in Keysight signal analysis. A base station represents an access point for a wireless device to communicate within its coverage area. It usually connects the device to other networks or devices through a dedicated high bandwidth wire or fiber optic connection. Base stations typically have a transceiver, capable of sending and receiving signals. In wireless communication networks, base stations or cell towers are evaluated and assessed for their functionality, performance, and dependability through a procedure known as base station testing. " A base station is called node B in 3G, eNB in LTE (4G), and gNB in 5G.
