

How to turn on the power in the telecommunications base station room

Overview

This article presents a scalable and stackable -48 V DC PoL solution that will address the high density power usage situations created by these high density networks from the tremendous growth in network traffic. Telecom and wireless network systems typically operate on -48 V DC. This acts as the “blood supply” of the base station, ensuring uninterrupted power. It includes:

AC distribution box: Distributes mains power and offers surge protection. As DC power. The idea of base stations is anchored in their function to provide coverage, capacity, and connectivity, hence allowing for extending the working capabilities of mobile phones and other radio gear. The checklist that follows (pp. 3 - 9) can be used for quality control of:

1. Telecom Room (TR) design during the Design Review phase
2. AC to DC power conversion is a cornerstone of telecom power supply systems.
