

Inverter power is too small

Overview

If your inverter is too small, it won't be able to draw enough power from the batteries to meet your needs, causing your system to run inefficiently or even shut down. Others oversize the system out of caution, assuming bigger is always better, without gaining meaningful benefits in everyday life. A typical beginner setup might look like this: a 10 kW inverter, a 5 kWh battery, and only 2 kW of solar panels. The inverter converts the direct current (DC) electricity produced by solar panels into alternating current (AC) usable in your home or business. Too large, and you're paying for power you'll never use. The sweet spot maximizes both performance and value.
