

Overview

SHEEFT is unlocking new opportunities for solar energy in urban environments by adapting flat rooftops with ultra-lightweight photovoltaic technology. Backed by the EU Innovation Fund, this project demonstrates how industrial innovation can accelerate Europe's energy transition. As the United States works toward decarbonizing the electricity system by 2035, solar capacity will need to reach one terawatt (TW), which will. Flat and low-slope roofs are particularly well-suited for solar installations. Their structural characteristics, adaptability and potential for efficient energy production make them a compelling choice for integrating renewable energy into building design. They are designed to be installed on flat or nearly - flat rooftops, utilizing the available space to capture sunlight and convert it into electricity. PV plant installations have increased rapidly, with around 1 terawatt (TW) of generating capacity installed as of 2022.
