

# Liquid-cooled energy storage power supply

## Overview

---

The liquid cooling system supports high-temperature liquid supply at 40-55°C, paired with high-efficiency variable-frequency compressors, resulting in lower energy consumption under the same cooling conditions and further reducing overall operational costs. The global installed capacity of battery energy storage is expected to hit storage between 2023 and 2027, and exceed 130 GW by 2030. Inflation Reduction Act has further increased projected solar and onshore wind capacity by y. High-density liquid cooling BESS is the only viable method to extract heat from the core of the module, making it a foundational engineering requirement, not an option. This shift is driven by cell technology (like 314Ah and 500Ah+ cells) and the relentless pursuit of lower Levelized Cost of. The recently-passed Inflation Reduction Act (IRA) delivers much-needed certainty to the energy storage market by providing a 30 percent Investment Tax Credit (ITC) for the next decade for projects that pair solar-and-storage as well as standalone storage installations.
