

# Lithium battery for wind-adjusting ship energy storage

## Overview

---

Lithium-ion batteries play a crucial role in storing the energy generated by wind turbines, smoothing out fluctuations in power output caused by variable wind speeds. This stored energy can then be dispatched as needed, ensuring a stable and reliable supply of electricity to the. Lithium batteries, as the dominant rechargeable battery, exhibit favorable characteristics such as high energy density, lightweight, faster charging, low self-discharging rate, and low memory effect. The development of lithium batteries for large energy applications is still relatively new. This paper systematically analyzes maritime vessels' energy management and battery systems, highlighting advances in lithium-based and alternative battery technologies. Moreover, advanced propulsion systems like shaftless rim propellers and the integration of shore power and modular containerized batteries. short- and long-duration energy storage, respectively. The International Maritime Organization's (IMO's) decarbonization targets make.
