A hybrid relay was modeled using passive techniques along with a suggestion for the operation of the newly formed Microgrid (MG), presenting a control philosophy of the regulators connected to the grid or being islanded, the latter defining the functions of the DGs as. The results presented in this chapter demonstrate the good performances of the proposed FCS-MPC and FSF-MPC approaches, such as fast dynamic response, multi-variable control, robustness to parametric uncertainties, and fixed switching frequency for the FSF-MPC. Microgrids constitute systems. DG growth drives new studies to predict different results in the electrical grid. The IEEE 1547 technical guidelines bring the possibility that in case of any failure that causes a shutdown, the operation is possible through intentional islanding provided by the electrical utility, continuing.
