

Mobile base station communication incoming line

Overview

The radio unit is that part of the electronics contained within the base station that processes the radio signal. It receives the incoming signals via the antenna from the mobile phones. A base station represents an access point for a wireless device to communicate within its coverage area. Base stations typically have a transceiver, capable of sending and receiving. The BSS is composed of two parts: The BTS and the BSC communicate across the specified Abis interface, enabling operations between components that are made by different suppliers. The radio components of a BSS may consist of four to seven or nine cells. " A base station is called node B in 3G, eNB in LTE (4G), and gNB in 5G.

Mobile base station communication incoming line

Base station

For example, in a wireless telephone system, the signals from one or more mobile telephones in an area are received at a nearby base station, which then connects the call to the land-line network.
