Overview

Lithium nickel manganese cobalt oxides (abbreviated NMC, Li-NMC, LNMC, or NCM) are mixed metal oxides of lithium, nickel, manganese and cobalt with the general formula $\text{LiNi}_x\text{Mn}_y\text{Co}_{1-x-y}\text{O}_2$. These materials are commonly used in lithium-ion batteries for mobile devices and electric vehicles, acting as the positively charged electrode, commonly called the cathode (though when char. Structure NMC materials have similar to the individual metal oxide compound (LiCoO_2). Lithium ions between the layers upon discharging, remaining between the lattice plan. In NMC cathodes, the reversible insertion (lithiation) and extraction (delithiation) of lithium ions during battery discharge and charge are facilitated by redox reactions involving changes in the oxidation states of atoms withi.
