

Photovoltaic grid-connected inverter starting voltage

Overview

In photovoltaic inverters, there is a rather strange parameter, that is, the inverter input starting voltage. This voltage is approximately 30V higher than the minimum operating voltage. For example, in the single - phase hybrid inverter shown below, the MPPT operating voltage is from 125V to 425V. Meaning that each individual string has to be of a certain size to reach the inverter start up voltage separately. So each string has to be above this voltage separately or does the whole array work to achieve this startup voltage independent of the. In DC, electricity is maintained at constant voltage in one direction.
