

Photovoltaic panel 5v voltage regulator circuit

Overview

The circuit comprises a single 5V controller, two transistors, two light-emitting diodes, five resistors, two capacitors, and a small battery. While a 4-V battery is indicated, 4.5 V (3 alkaline cells in series) or 3. This device is designed to be a simple, inexpensive 'comparator', intended for use in a solar cell power supply setup where a quick 'too low' or 'just right' voltage indicator is needed. The basic functions of these amazing devices is to. Powered with solar panel, the circuit will give you 5V pure regulated DC voltage. Sunlight is bright enough to produce a voltage higher than 1.
