## Overview

---

For photovoltaics (PV) and thin film batteries (TFB) to cost compete against fossil fuels and traditional batteries high manufacturing yield is critical. Pinholes in the CdS layer of CdTe/CdS and CdS/ CIGS PV devices and the LiPON layer of TFBs result in yield loss and lower performance. SEM plan. ver the substrate is a common issue for thin-film solar cells such as perovskites. Here, we demonstrate that certain combinations of contact layers suppress the negative impact of pinholes better than others. wide range of dielectrics are used for photovoltaic (PV) applications (anti-reflection, passivation, insulation and masking layers) usually applied on large surfaces often presenting a texture or an important roughness. They say the findings should push scientists and engineers to prioritize the production of pinhole-free films to make perovskites. With the rapid development of the solar photovoltaic industry, the efficient and stable operation of PV modules is crucial for the reliability of energy systems. However, PV panels are prone to various defects such as cracks, micro-cracks, and hot spots during manufacturing, installation, and.
