

Photovoltaic power inverter inductor heating

Overview

In a photovoltaic inverter, there are usually four kinds of inductors, DC common mode inductor, boost inductor, filter inductor, and AC common mode inductor. The following analysis addresses these two questions in combination with inverter cooling principles. Using glue-filled inductance can reduce the temperature inside the solar inverter and the inductance, and can also significantly improve the inductance. While solar irradiance is a key factor in energy generation, the impact of high temperatures on solar inverters is often overlooked. Excessive heat can reduce inverter efficiency, limit power output, degrade essential components, and ultimately shorten an inverter's lifespan. They convert direct current (DC) generated by PV modules into alternating current (AC). In this process, power devices (such as IGBTs and MOSFETs), inductors, capacitors, and transformers all produce heat.
