

Solar thermal power generation technology prospects

Overview

The growth of global energy demand and the aggravation of environmental pollution have prompted the rapid development of renewable energy, in which the solar photovoltaic/thermal (PV/T) heat pump system, as a technology integrating photovoltaic power generation and thermal energy conversion, has. Solar thermal power generation, with its regulation characteristics comparable to conventional thermal power units, can quickly and deeply participate in power grid peak shaving and frequency modulation, thereby enhancing the flexibility of the power system. It is a promising renewable energy. The Future of Solar Energy considers only the two widely recognized classes of technologies for converting solar energy into electricity — photovoltaics (PV) and concentrated solar power (CSP), sometimes called solar thermal) — in their current and plausible future forms. However, their dependence on finite resources and low conversion efficiencies.
