

# The most potential energy storage battery

## Overview

---

Lithium-ion batteries dominate both EV and storage applications, and chemistries can be adapted to mineral availability and price, demonstrated by the market share for lithium iron phosphate (LFP) batteries rising to 40% of EV sales and 80% of new battery storage in 2023. Lithium-ion batteries are currently the most widely used type, followed by alkaline and lead-acid batteries. However, each comes with notable drawbacks: lithium-ion batteries are prone to overheating and, in extreme cases, can explode; alkaline batteries are unsuitable for high-drain applications;. Developments in batteries and other energy storage technology have accelerated to a seemingly head-spinning pace recently — even for the scientists, investors, and business leaders at the forefront of the industry. Strong growth occurred for utility-scale battery projects, behind-the-meter batteries, mini-grids and solar home systems for.
