Our proprietary vanadium solid-state batteries (VSB) technology defines a new class of battery energy storage infrastructure, delivering ultra-safe, high-power solutions with a manufacturing model built for rapid global rollout. Built for applications that demand uncompromising performance, safety. As grids worldwide strain under the variability of solar and wind, vanadium ion batteries (VIBs) emerge with electrochemical properties tailored to solve grid-scale storage paradoxes. Unlike lithium-ion counterparts, VIBs leverage aqueous vanadium electrolytes and carbon electrodes to achieve. Associate Professor Fikile Brushett (left) and Kara Rodby PhD '22 have demonstrated a modeling framework that can help guide the development of flow batteries for large-scale, long-duration electricity storage on a future grid dominated by intermittent solar and wind power generators. The Alloy Index tracks how this emerging field is reshaping the market for industrial alloys.
