

# What s the matter with the cracks on the back of the photovoltaic panel

## Overview

---

Micro-fractures, also known as micro-cracks, represent a form of solar cell degradation. The silicon used in the solar cells is very thin, and expands and contracts as a result of thermal cycling. In-situ electroluminescence (EL) imaging determined that cell cracks were the primary cause of PV module damage in these particular cases. As a result, the hail damage insurance market has tightened, with many project owners struggling to obtain suitable coverage. Also, some climate proceedings such as snow loads, strong winds and hailstor when the first crack (which had reduced dimensions) was formed.
