

Wind power plant operates in three shifts

Overview

Wind (moving air that contains kinetic energy) blows toward the turbine's rotor blades. Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan—wind turbines use wind to make electricity. Wind flow. In a conventional power plant (fueled by coal or natural gas), combustion heats water to steam and the steam pressure is used to spin the blades of a turbine. The turbine is then connected to a generator, which is a giant coil of wire turning in a magnetic field. They're serving a very useful purpose, however. Have you ever stopped to wonder how. Wind energy is the kinetic energy of the motion of a large mass of air on the surface of the Earth, which is produced by the non-uniform heat of the Earth's surface by the Sun. Here we explain how they work and why they are.
